

The 'sopra-ntts' package

Documentation for the 'sopra-ntts' package | Version v1.0.00

2. December 2019

Florian Sihler (florian.sihler@uni-ulm.de)

1 General

1.1 Why, wherefore, whence?

This $\text{\LaTeX}$ 2 ϵ -package outsources the Futura-like TikZ font from the Sopra project of the winter semester 2019 and summer semester 2020. This documentation was created together with `sopra-base.cls`, as well as the `sopra-documentation.sty` package.

The `sopra-listings` package is used to visualize the individual code snippets. The corresponding package should also be embedded in this document: .

1.2 Dependencies

This package includes the following packages:

- `tikz`

All of these packages should be part of any common $\text{\LaTeX}$ -distribution.

1.3 Installation

The package is not distributed as a `.dtx` file, which is why the following options are available:

- The package can be placed in the same directory as the document. In this case, the inclusion command reads:

```
\usepackage{sopra-ntts}
```

- The package can be placed in a subdirectory, or in a directory shipped alongside the document. In this case, it is specified via the (relative) path:

```
\usepackage{./My/Path/to/sopra-ntts}
```

- The package can be placed (via a symlink or similar) into your own *texmf* tree. For example, on Linux using texlive, the package can be placed here: `~/texmf/tex/latex/`. The directory can be created and then updated using `texhash ~/texmf`. The package can now be used like any other installed package:

```
\usepackage{sopra-ntts}
```

1.4 Further Notes

In version v1.0.00 (`\thesonversion`^{→ p. 2}) there are no further notes.

2 Commands and Environments

Note that the prefix `env@` only indicates the nature of an environment and is not part of the actual identifier!

Also note: for all titles and lengths to be resolved correctly, the document generally needs to be compiled twice to produce a correct display.

▷ `\sonNtts[scale=0.06]{color}`

Must be placed inside a “tikzpicture” environment and writes the lettering (here in black):

NO
TIME
TO
SPY

The command was never fundamentally designed for general use. The use of the coordinates can be found in the definition of the title pages of the document classes.

2.1 General Commands

▷ `\thesonversion`

Returns the current version of the package. This gives: `\thesonversion: v1.0.00`

Note: via `\value{sonversion}` the version can be obtained as a 4-digit number: 1000.
